

Azure Files identity auth — the 60-second triage

Start at a failed mount. Ask the questions in order; the first command that returns "no" points to the cause.

Trace tool: AD DS → netsh / Wireshark (UDP-TCP 88). Entra Kerberos → Fiddler + Kerberos.NET (KDC proxy over HTTPS; Wireshark can't read it). **One command for AD DS:** Debug-AzStorageAccountAuth.
